

Multi-Scale Foveated Blur: Sharp Center with Progressive Peripheral Degradation

Antelope

Clean ($\sigma = 0$)

Fovea-low ($\sigma = 2$)

Fovea-mid ($\sigma = 8$)

Fovea-high ($\sigma = 14$)

Basketball

Birthday Cake

Aircraft Carrier

Each row shows the same test stimulus with increasing foveated blur. Central regions remain sharp while the periphery progressively degrades, simulating human retinal foveation. The 4 scales are concatenated as visual features for the msblur6 modality (edge: 24.3%, msblur6: 22.3% of ensemble weight).
